Sprint Reflection 1
Due: February 28, 2026

The goal for the first sprint was to establish webpage architecture. This included the home page, login page, and user page, with a minimal theme across all pages for the sake of functionality. Once I began writing my code, the scope of pages required was expanded by one to include a register page. This page is similar to the login page, but obviously where a new user registers an account instead of existing members logging in. Naturally, what came with these html pages was their shared css style document. I kept the styling of pages to be as similar as possible in order to share as much of the css style document as possible. The html pages are properly linked to each other, which was an implicit goal of this sprint based on the structure of the application outlined in my proposal.

All goals were met for this sprint.

Next sprint will focus primarily on facilitating the functions of a user logging in and logging out. This includes user account creation, password hashing, and password validation. I am hopeful to also begin tackling GPS services for the post architecture and post interaction.
